

Getting Started with Attested

Your first 10 minutes with evidence authentication

Welcome to Attested

Attested is the only platform that combines viewer identity watermarking, SHA-256 integrity verification, and court-specific FRE 902(13) certificate generation in one workflow. This guide walks you through your first 10 minutes.

Step 1: Create Your Account

Visit attested.legal and click Start Free. Sign up with Google, Microsoft, or email. The free Essential plan includes 200 MB storage, 1 case, and basic certificates.

Step 2: Create Your First Case

Click Cases in the sidebar, then New Case. Enter the case number, court, judge name, and party names. Select a court template (EDLA, MDLA, WDLA, Louisiana State, or Generic Federal). This information populates your certificates automatically.

Step 3: Upload Evidence

Drag and drop files into the upload area or click Browse. Attested accepts documents, images, video, and audio up to 2 GB per file. At upload, the system computes a SHA-256 hash and assigns a Bates number.

Step 4: Share Evidence

Select a file and click Share. Choose Temporary Access (auto-expires after 24h, 48h, or 7 days) or Preserved Evidence (litigation hold, protected from deletion). Recipients authenticate via email before viewing. Their identity is watermarked into every frame.

Step 5: Generate a Certificate

Click the Certificate button on any file. Select your certificate type: FRE 902(13) for federal self-authentication, FRE 902(14) for hash verification, or LA Art. 901 for Louisiana state courts. The certificate auto-populates from your case data and access log.

Step 6: Mark Exhibits

Use the Exhibit Stickers feature to mark evidence for trial. Digital stickers match the 2-inch by 1-inch courtroom standard with auto-incrementing numbers, party designations, and court-specific formatting.

What Happens Automatically

- SHA-256 hash computed at upload (proves file integrity)
- Every view, download, and share logged with viewer identity, IP, timestamp, and device
- Viewer email watermarked into visual content at view time (survives screenshots)

- Bates numbers auto-assigned per case prefix
- Certificate data pre-populated from stored metadata and access logs
